Options dialog box closes and you're ready to begin making changes to your photo. 7. \*\*To improve the overall quality of your picture, make sure that the "Process Color" setting is set to "Separate," as shown in Figure 3-3. Separate takes the color values of the original image and keeps them separate from the values of the enhancements, then combines the two. When you do this, you get a more color-accurate editing environment\*\*. You also can choose "Merge," "Create Clipping

The present invention relates to a safety ski binding which is intended to ensure that the forces exerted by one ski are transmitted to the other ski to the point of initiating an unlocking mechanism in the binding. Ski bindings exist for both alpine skiing and cross-country skiing, the systems being of the mechanical type or the magnetically driven type. In the mechanical systems, a locking bolt is mounted with play about a fixed

---

point on the shoe and is moved back and forth between a locked and an unlocked position. When the ski boot is released, the locking bolt is driven to the unlocked position by means of a spring and the locking bolt is maintained in this position by means of a locking mechanism. The drawbacks of these mechanical ski bindings are that a worn out boot strap or the binding itself has to be replaced. Even if the boot is in good condition, the strap often wears out, and the bindings need to be

---

taken to a specialized shop. In the magnetically driven ski bindings, the locking bolt is a piezoelectric drive element which interacts with a keeper plate to vary the position of the locking bolt as a function of the forces transmitted from one ski to the other ski. When the forces exceed a threshold value, the locking bolt is moved to the unlocked position. The threshold value depends on the mechanical characteristics of the locking bolt. With this type of binding, the locking bolt is retained in a locking

---

position in which it is free to move, or it is retained in an unlocked position in which it is unable to move. However, if the forces transmitted from one ski to the other ski drop below the threshold value, the locking bolt is returned to its locked position. If the forces are too low, the locking bolt is no longer returned to its locked position. If the forces are too high, the locking bolt is released from its locked position and is returned to its unlocked position. The drawback of the magnetically

---

driven ski bindings is that they are sensitive to the direction and intensity of the forces. A given level of force applied in one direction may not cause the locking bolt to return to its locked position, while a force applied in the opposite direction will cause the locking bolt to return to its locked position. This makes it virtually impossible to ensure a reliable transmission of forces between the binding and the boot. U.S. Pat. No. 5,927,933 has described a ski binding having a locking bolt for

locking a ski shoe to a ski boot.

Status and symptoms of individuals with chronic multisystem disease: a systematic review. Chronic multisystem disease (CMSD) is a condition with considerable adverse impacts on the health and health-related quality of life of individuals and their families. Review of the literature indicates

---

that knowledge of CMSD, including the common symptoms, is limited and there is a lack of standardisation. The purpose of the review was to identify the incidence and prevalence of CMSD as well as to ascertain the main symptoms associated with this condition, a lack of standardisation for categorising and reporting research studies being one of the issues. We conducted a review of MEDLINE (PubMed and Ovid) and EMBASE (Elsevier) from January 1993 to September 2015.

---

A search strategy was developed combining search terms for CMSD and symptoms. All studies that met the inclusion criteria were categorised and summarised in tables. The top two keywords were used to refine
